+48 534-766-763

Jaworzno, Poland

PROFILE

Platform / DevOps engineer owning production releases and Spinnaker modernization for an enterprise Data & AI platform. Builds secure Kubernetes delivery, AWS automation and self-service workflows across cloud and customer-managed environments.

TECHNICAL EXPERTISE

Delivery & containers

Kubernetes / IKS, Docker / Compose, Spinnaker, Halyard, Jenkins, Git

Cloud & automation

AWS, Terraform, Ansible, Python, Bash, PowerShell

Security

Vault, workload identity, mTLS, ALB / WAF

Observability

Prometheus, Grafana, OpenSearch

Data & systems

MySQL / AWS RDS, Redis, Liquibase, Jsonnet, Linux, Windows Server

Polish native
English C1

Fully remote
EU / international
contracts

EXPERIENCE

DevOps / CI/CD Platform Engineer

Cloud Services **Łukasz Kwietniak**

Mar 2026 - Present

Confidential enterprise Data & AI platform
Kubernetes / IKS · Spinnaker · ~20k commits/week

723

Release Projects

165

Engineering teams

100+

Codegen projects

- Own **Spinnaker release execution from DEV through STAGING to protected PROD**, with separate approval and access gates. Verify revisions, artifact provenance and image digests; drive configuration reviews, Halyard updates and Kubernetes/pipeline validation. Executed or coordinated rollback after release regressions.
- Led a runtime metadata migration across **723 Release Projects owned by 165 engineering teams**. Built runtime-inference tooling and centralized code generation for **100+ projects**, corrected classifications distorted by build dependencies and helper containers, and coordinated owner reviews.
- Extended **Code Impact Analysis** with generic Release API metadata for service-aware bad-commit filtering. Retained potentially affected services when metadata was missing; validated the new read path through a controlled DEV rollout.
- Led implementation of **workload identity, mTLS and Vault-backed credentials**, using CSI delivery and least-privilege authentication controls. Collaborated with Security and platform teams on secure service routing across AWS, Azure and GCP.
- Own **HIGH/CRITICAL vulnerability remediation** across Spinnaker services, from dependency upgrades and image validation through controlled Kubernetes rollout.
- Lead the phased **Redis-to-MySQL/AWS RDS migration** for four Spinnaker services, covering Liquibase schemas, TLS, secrets, fallback paths and Halyard integration, with environment-isolated validation and staged production adoption.
- Manage **Redis rotations as backup-gated maintenance**, verifying persistence settings, recovery, retained pipeline history and dependent-service health before restoring normal operations.

EXPERIENCE CONTINUED

DevOps Engineer

Cloud Services Łukasz Kwietniak

Apr 2025 - Present

US enterprise SaaS platform
AWS · Customer-managed & offline environments

- Migrated **MySQL, Redis, NGINX and application services from direct Linux deployments to Docker**. Created Dockerfiles and Makefiles and rebuilt install/upgrade logic, supporting Node.js modernization and consistent deployments.
- Rebuilt **Jenkins, Ansible and Terraform lifecycle automation** for install, upgrade, clone, destroy, backup, restore and rollback, enabling self-service support tasks. Added revision-aware cutover and retirement safeguards; infrastructure refreshes preserve application state, configuration and API tokens.
- Continuously improve **self-service CI/CD** with automatic capability detection, safer parameters, smarter upgrades and generated-credential storage in 1Password, reducing manual steps and reliance on operator knowledge.
- Delivered major parts of the team-designed **AWS ALB/WAF ingress**, moving TLS termination, geo-blocking and traffic protection to managed ingress backed by private application targets. Contribute to IPAM/private-network modernization preparing broader public-IP removal, alongside CrowdStrike Falcon rollout and access hardening.
- Contributed to a team initiative reducing the main development AWS account from **approximately \$50k to \$15k/month**, through Jenkins self-service stop/start, idle-resource governance and cleanup of orphaned resources and unused environments.
- Developed **EC2 Auto Scaling automation for up to 50 workers**, with a default warm pool of **25 prepared, stopped instances**. Used Terraform, Lambda/EventBridge, Ansible and Jenkins for worker AMIs, capacity reconciliation, workload-aware scale-in protection and termination cleanup.
- Deliver quarterly upgrades and **fully offline Windows Server/Linux workflows** using Ansible, Bash, PowerShell and Docker. Resolve database, network, storage, permissions and TLS issues; standardize prerequisites, artifact inventories, QA checks and documentation.
- Built **CI/CD for legacy and new licensing services** using Jenkins, ECR, Secrets Manager, Terraform and Ansible, with version-specific Docker upgrades, licensing-data backup/rollback protection and production runbooks.

IT Support / Service Desk Analyst
(English)

Capgemini · Katowice

2024 - 2025

Supported enterprise users through Azure MFA, Active Directory, VMware / virtual-machine administration and ServiceNow.
